

# Calculating with time in football

## The Maths

Maths resource

Upper KS2: Ages 9-11

# Before you get started

Can you remember how to:

- count in 5s? E.g. 5, 10, 15...
- read the time on an analogue clock?
- read the time on a digital clock?
- read the time as a 24 hour clock?

# Before you get started

## Types of clock

### A digital clock

A **digital** clock or watch has a number display.

### An analogue clock

An **analogue** clock or watch has hands to show 12 hour clock times. We use am for times before noon (midday) and pm for times after noon.

### A 24-hour clock

For **24-hour clock times**, the hours are numbered in a day from 00:00 to 23:59. Times always have four figures. Four o'clock in the afternoon, or 4:00pm, is 16:00 in the 24-hour clock time.

# Before you get started

Can you join up the correct periods of time?

There are:

60 seconds in...

60 minutes in...

24 hours in...

1 day

1 minute

1 hour

# Analogue clock

Here is an  
analogue clock:

And this clock  
has the minutes  
shown in  
increments  
of 5 minutes:

We can think of this as a straight number line:

This is useful when we add or subtract minutes and it  
can help us to solve problems working out time.

# Glossary of football terms

In football we use timelines to highlight when key match events took place.

## Key

**KO** = kick off

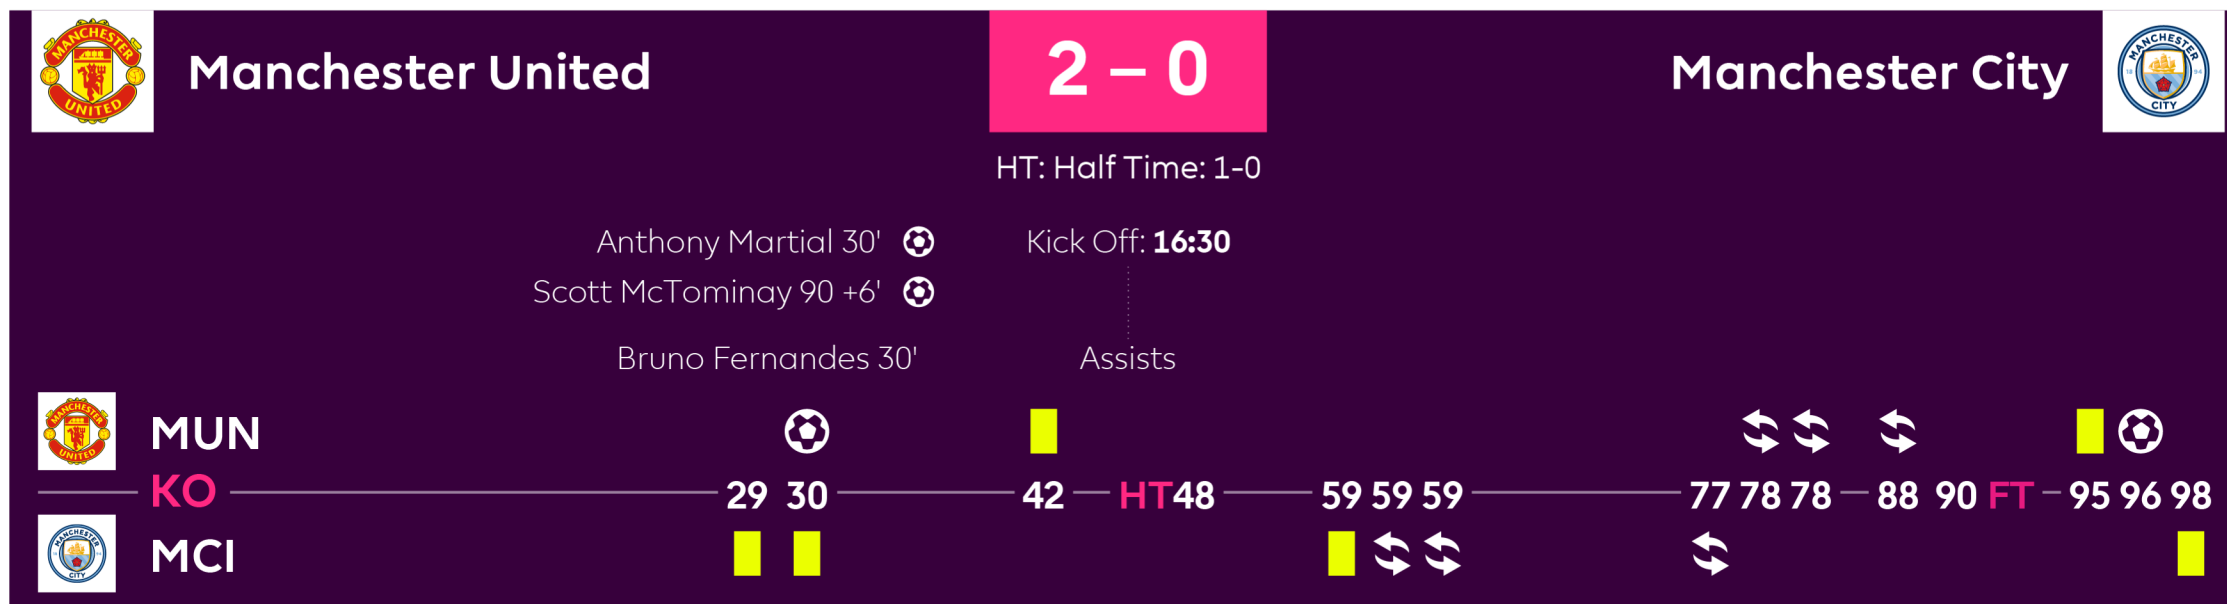

**HT** = half time

**FT** = full time

 = goal

 = yellow card

 = substitution

# Counting up

Calculating with time in football

# Counting up

When the minute hand points to **4**, that means it is **20 minutes past** the hour.

When we reach **60**, it is **one hour**.

5	10	15	20	25	30	35	40	45	50	55	60
1	2	3	4	5	6	7	8	9	10	11	12

# Adding minutes to under 60 minutes

We can use the timeline to help us add minutes.

For example: 23 minutes and 25 minutes would give a total of 48 minutes. We can count on 25 on the number line from 23.

# Adding minutes to over 60 minutes

We need to be careful if the total adds up to more than **60**:

23 minutes and 46 minutes = **69** minutes.

This is **1 hour (60 minutes)** and **9 minutes**

$$\begin{array}{r} 23 \\ + 46 \\ \hline 69 = 60 + 9 \end{array}$$

# Adding and subtracting mixed units of time

Calculating with time in football

# Adding mixed units of time

To add mixed units of times (e.g. hours and minutes) together, it is easiest to **first convert them all to the same**.

For example:

A player played in one match for **38 minutes**, in a second match for **1 hr 15 mins** and in a third match for **1 hr 30 mins**.

What is the total time he played?

To work out the total, we need to convert the hours and minutes to minutes.

**Step 1:** convert the hours and minutes to minutes.

1 hr = 60 minutes so:

- **1 hr 15 mins** is  $60 + 15 = 75$  mins
- **1 hr 30 mins** is  $60 + 30 = 90$  mins

**Step 2:** add the minutes together.

- $38 + 75 + 90 = 203$  minutes

# Adding mixed units of time

So now we can add **38**, **75** and **90** mins which gives us a total of **203 mins**.

**Remember there are 60 minutes in 1 hour!**

How many groups of 60 are in **203**?

- $60+60+60 = 180$  mins so that is **3 hrs**.
- Count up from 180 to 203 and we have another **23 mins**
- So the total time played is **3 hours and 23 minutes**

# Subtracting mixed units of time

Remember to do the same for subtraction

For example:

*A team took two corners 73 seconds apart - if the second one was taken on 40 minutes, when was the first one taken?*

73 seconds = **1 minute** and **13 seconds**

# Using a number line for subtraction

You could also use a number line to count back:

# Calculations involving times of the day

Calculating with time in football

# Calculations involving times of the day

**Example of using a timeline to solve problems with different times of the day.**

*A match is 90 minutes. There is a 15 minute half time break and 7 minutes added time at the end. If it starts at 4:00pm, what time does it finish?*

# Calculations involving times of the day

Lets try adding this up on a timeline and try looking at it on the clock.

# Calculations involving times of the day

Another way to complete this problem would be to add up all the times.

- 90 minutes + 15 minutes + 7 minutes = 112 minutes
- 112 minutes = 1 hour (60 minutes) and 52 minutes
- Count on from 4 pm: 1 hour takes you to 5:00pm and 52 minutes would end at 5:52pm
